## **CLAIMS**

## What is claimed is:

5

10

15

20

30

35

1. An isolated polynucleotide comprising:

- (a) a nucleotide sequence encoding a polypeptide required for proper root formation, wherein the polypeptide has an amino acid sequence of at least 70% sequence identity, based on the Clustal V method of alignment, when compared to one of SEQ ID NO:6, 8, 30, or 38; or
- (b) a complement of the nucleotide sequence, wherein the complement and the nucleotide sequence consist of the same number of nucleotides and are 100% complementary.
- 2. The polynucleotide of Claim 1, wherein the amino acid sequence of the polypeptide has at least 75% sequence identity, based on the Clustal V method of alignment, when compared to one of SEQ ID NO:6, 8,30, or 38.
- 3. The polynucleotide of Claim 1, wherein the amino acid sequence of the polypeptide has at least 80% sequence identity, based on the Clustal V method of alignment, when compared to one of SEQ ID NO:6, 8,30, or 38.
- 4. The polynucleotide of Claim 1, wherein the amino acid sequence of the polypeptide has at least 85% sequence identity, based on the Clustal V method of alignment, when compared to one of SEQ ID NO:6, 8,30, or 38.
- 5. The polynucleotide of Claim 1, wherein the amino acid sequence of the polypeptide has at least 90% sequence identity, based on the Clustal V method of alignment, when compared to one of SEQ ID NO:6, 8,30, or 38.
  - 6. The polynucleotide of Claim 1, wherein the amino acid sequence of the polypeptide has at least 95% sequence identity, based on the Clustal V method of alignment, when compared to one of SEQ ID NO:6, 8, 30, or 38.
  - 7. The polynucleotide of Claim 1, wherein the amino acid sequence of the polypeptide has at least 99% sequence identity, based on the Clustal V method of alignment, when compared to SEQ ID NO: 6, 8, 30, or 38.

WO 2006/006956

10

15

20

30

35

- 8. The polynucleotide of Claim 1, wherein the amino acid sequence of the polypeptide comprises one of SEQ ID NO:6, 8,30, or 38.
- 9. The polynucleotide of Claim 1 wherein the nucleotide sequence comprises one of SEQ ID NO:5, 7,29 or 37.
  - 10. The isolated polynucleotide of Claim 1, wherein the nucleotide sequence comprises at least two motifs selected from group consisting of SEQ ID NOs:9, 10, 11, 12 and 13, wherein said motif is a substantially conserved subsequence.
- 11. A functionally equivalent subfragment of the isolated polynucleotide of Claim 1, wherein said subfragment is useful in antisense inhibition or cosuppression of expression of a nucleic acid sequence encoding the polypeptide of Claim 1.
- 12. An isolated nucleic acid fragment comprising a promoter consisting essentially of SEQ ID NO:2, 3 or 4, or a substantially similar and functionally equivalent subfragment of said promoter.
- 13. A recombinant DNA construct comprising the isolated polynucleotide of Claim 1 or a functionally equivalent subfragment thereof, operably linked to at least one regulatory sequence.
- 25 14. The recombinant DNA construct of Claim 13, wherein said at least one regulatory sequence comprises the promoter of Claim 12.
  - 15. A plant comprising in its genome the recombinant DNA construct of Claim 13.
    - 16. A seed obtained from the plant of Claim 15.
  - 17. The plant of Claim 15, wherein said plant is selected from the group consisting of rice, corn, sorghum, millet, rye, soybean, canola, wheat, barley, oat, beans, and nuts.
    - 18. Transformed plant tissue or plant cell comprising the recombinant DNA construct of Claim 13.

WO 2006/006956 PCT/US2005/003332

19. A method of altering root structure during plant development, comprising:

- (a) transforming a plant with the recombinant DNA construct of Claim 13;
- (b) growing the transformed plant under conditions suitable for the expression of the recombinant DNA construct; and

5

10

15

20

25\

30

35

- (c) selecting those transformed plants having altered root structure.
- 20. A method to isolate nucleic acid fragments encoding polypeptides associated with altering root structure during plant development, comprising:
- (a) comparing SEQ ID NOs:6,8 30, or 38 with other polypeptide sequences associated with altering root structure during plant development;
- (b) identifying the conserved sequences(s) or 4 or more amino acids obtained in step (a);
- (c) making region-specific nucleotide probe(s) or oligomer(s) based on the conserved sequences identified in step (b); and
- (d) using the nucleotide probe(s) or oligomer(s) of step (c) to isolate sequences associated with altering root structure during plant development by sequence dependent protocols.
- 21. A method of mapping genetic variations related to altering root structure in plants comprising:
  - (a) crossing two plant varieties; and
  - (b) evaluating genetic variations with respect to:
  - (i) a nucleic acid sequence selected from the group consisting of SEQ ID NO:1,2,3,4,5,7, 28, 29, or 37; or
  - (ii) a nucleic acid sequence encoding a polypeptide selected from the group consisting of SEQ ID NO:6, 8, 30, or 38;

in progeny plants resulting from the cross of step (a), wherein the evaluation is made using a method selected from the group consisting of: RFLP analysis, SNP analysis, and PCR-based analysis.

- 22. A method of molecular breeding to alter root structure during plant development in plants comprising:
  - (a) crossing two plant varieties; and
  - (b) evaluating genetic variations with respect to: .
  - (i) a nucleic acid sequence selected from the group consisting of SEQ ID NO:1, 2,3,4,5, 7, 28, 29, or 37; or

5

(ii) a nucleic acid sequence encoding a polypeptide selected from the group consisting of SEQ ID NO:6, 8, 30, or 38;

in progeny plants resulting from the cross of step (a), wherein the evaluation is made using a method selected from the group consisting of: RFLP analysis, SNP analysis, and PCR-based analysis.
